

# **SMART AQUA EPOXY PUTTY** Underwater Epoxy Polymer Putty Repair System

**SMART AQUA EPOXY PUTTY** is an underwater or in water epoxy polymer putty repair system that can be applied to damp, wet or underwater repair situations to rebuild or repair substrates and pipes. Works on metal, fibreglass, concrete, glass, ceramic tile, glass and piping materials in fresh or salt water.

**CUT, CLEAN, MIX, APPLY**

MADE IN CHINA

## Directions

1. For best adhesion, roughen the surface to be bonded making sure the area is free of grease, dust and dirt.
2. Remove the **SMART AQUA EPOXY PUTTY** from the tube and cut off the required amount. Put the unused portion back in the tube re-attaching disc on the end of the cut section and replace cap to prevent drying.
3. We recommend wearing protective gloves, knead and mix the putty together with fingers until a uniform colour is achieved. At this point the putty will get quite warm.
4. Apply the mixed putty within 2 minutes.
5. Mould and shape to desired shape on repair. Remove any excess. For a smooth appearance, rub the putty with wet fingers or damp cloth before the putty hardens.
6. The putty will harden within 15 minutes and form a strong bond.
7. Wash hands thoroughly with soap and water after use.
8. **SMART AQUA EPOXY PUTTY** completely cures in 60 minutes. Once cured, it can be sanded, filed, drilled, machined and painted.
9. Will not yellow when in sunlight or U.V.

## Tips

1. If **SMART AQUA EPOXY PUTTY** is being used at low temperature, it may take more time to cure.
2. If the putty hardens before use, it may be softened with a hair dryer.
3. Always store unused putty in the sealed container re-attaching the disc at the end of the cut section and keep it in a cool dry place.

## Cautions

1. Keep out of reach children.
2. Contains polymer resin which may cause irritation to sensitive skin. If that is the case, wear gloves when using.
3. Do not swallow or contact with eye. If contact occurs, flush with water and contact physician.
